

Dear Participant,

Please find below the Project for Statistical Learning course. This is an individual assignment. Kindly submit it before it's deadline.

Please find below the zip file to the code data set and python notebook.

La Liga is one of the most popular professional football leagues in the world. Top football teams, around the world, come together to fight it out and claim the trophy for their own. The first data set contains comprehensive data of all the teams so far participated. The data set has information about how many goals each team scored, conceded and how many times they came within first 6 positions.

You are required to do the following:

1. Clean the data set (remove the missing values)
2. Find out which team came under top 6 most times, win rate for the teams etc.
3. Categorize the teams based on when they started playing in the league.

The second data set encompasses data taken from tweets posted by Trump during Presidential elections. The data set has information on id, timestamp of the tweet and the information contained in the tweet.

You are required to do the following:

1. Import the data set
2. Plot how many tweets Trump has posted each day.
3. Compute how many tweets has set of particular strings. For eg: Based on no of times, word "I am happy" is tweeted, we can reasonably say that Trump is excited/ not excited about elections.

Please Note:

- Questions are mentioned in the Python notebook itself. You just need to answer with your code in the notebook.
- Total marks allotted for this assignment is 50.
- Assignment final submission should be a URL to your Github repository.

Regards

Program Office
